Abstract: We outline a framework for multiple imputation of nonignorable item nonresponse when the marginal distributions of some of the variables with missing values are known. In particular, our framework ensures that (i) the completed datasets result in design-based estimates of totals that are plausible, given the margins, and (ii) the completed datasets maintain associations across variables as posited in the imputation models.

There are several ways of dealing with nonresponse problems. For unit nonresponse normally weighting methods are applied. To compensate for item nonresponse a range of missing data methods exist, such as available case method, imputation methods, weighting methods and model-based procedures such as maximum likelihood estimation.

In summary, multiple imputation is an attractive and feasible approach for analyzing data sets with missing values and for assessing and potentially correcting for nonresponse bias. This analysis demonstrates the utility of multiple imputation in a large population-based study of prostate disease. ACKNOWLEDGMENTS

Multiple imputation (Rubin, 1987) was rst conceived as a tool that statistical agen- cies could use to handle nonresponse in large data sets that are disseminated to the public. The basic idea is for the statistical agency to simulate values for the missing data repeatedly by sampling from predictive distributions of the missing values.
