The wall of the heart consists of three layers: The epicardium is the visceral layer of the serous pericardium. The myocardium is the muscular part of the heart that consists of contracting cardiac muscle and noncontracting Purkinje fibers that conduct nerve impulses. Cardiac cells (cardiomyocytes) are in this layer.

Heart as a double pump. The cardiovascular system, the body ' s pressurized blood re-circulation system is powered by a double pump, the heart. Cardiac output of the heart is regulated by intrinsic factors, the nervous system and the endocrine system. The human heart is composed of two filling and two pumping chambers, the atria and the ventricles. The right ventricle, a low-pressure output system drives blood into the thin walled arteries of the lung, the pulmonary arteries.

Study Guide Answers: Blood and the Cardiovascular System

The circulatory system — or cardiovascular system — consists of the heart and the blood vessels. The heart, the main organ of the circulatory system, causes blood to flow. The heart ' s pumping action squeezes blood out of the heart, and the pressure it generates forces the blood through the blood vessels. Anatomically speaking, the heart is only about the size of your fist.
